Occupation, model tables

June 5, 2026

Table 1: Elasticities of labor supply using different experiments

	Change in net wages	Change in pension points
Elasticity of labor supply	0.052	1.227

Table 2: Lifecycle model: counterfactual experiments

	Pension gender gap	Women's labor hours	Average age at retirement	Welfare gains wrt baseline (%)
Baseline	0.498	17.22	65.10	0.0
Caregiver credits	0.474	17.55	64.99	0.222
Caregiver credits, no threshold	0.469	17.63	64.99	0.249
Income tax deduction	0.487	17.83	65.02	0.419

NOTES: The experiments in the last three rows generate the same government revenue. Welfare gains are measured as the percentage increase in baseline consumption that makes women indifferent between the baseline and the policy experiment. Reforms apply while the child is aged 3-10.

Table 3: Model parameters and fit

Parameter	Value	Target statistics		
		Name	Data	Model
Cost of working - mini (q_{10})	0.143	Share mini-jobs	0.234	0.234
Cost of working - part (q_{20})	0.242	Share part-time	0.181	0.181
Cost of working - full ($q_{38.5}$)	0.556	Share full time	0.267	0.266
Fixed effects distribution (q_{LIM})	0.097	Effect of the reform on non-marginal log earnings	1.158	1.095

Table 4: Model Fit: Validation Moments

Effect of reform on:	Data, value	Data, Std. Error	Model
Pension points	0.200	(0.035)	0.121
Behavioral pension points	0.103	(0.033)	0.033
Log earnings (cond. on regular empl.)	0.162	(0.148)	-0.026
Regular employment	0.109	(0.050)	0.122
Hours worked in regular empl.	2.278	(1.646)	2.656
Additional moments:			
Reform effect on full employment (cond. on regular empl.)	—	—	-0.029
Reform effect on marginal employment (cond. on working)	—	—	-0.145
Marginal propensity to earn (MPE)	-0.54	—	-0.555

NOTES: The marginal propensity to consume is computed using the methodology in [**?**].
