Occupation, model tables

July 9, 2026

Table 1: Elasticities of labor supply using different experiments

	Change in net wages	Change in pension points
Elasticity of labor supply	0.052	1.227

Table 2: Lifecycle model: counterfactual experiments

	Pension gender gap	Women's labor hours	Welfare gains wrt baseline (%)
Baseline	0.514	17.62	0.0
Caregiver credits	0.483	18.07	0.257
Caregiver credits, no threshold	0.476	18.21	0.294
Income tax deduction	0.500	18.38	0.503

NOTES: The experiments in the last three rows generate the same government revenue. Welfare gains are measured as the percentage increase in baseline consumption that equates womens expected life-cycle utility at $t = 0$ under the policy experiment to its baseline level. Reforms apply while the child is aged 3–10; hours worked are averaged over the periods preceding the opening of the retirement window.

Table 3: Model parameters and fit

Parameter	Value	Target statistics		
		Name	Data	Model
Cost of working - mini (q_{10})	0.142	Share mini-jobs	0.234	0.2336
Cost of working - part (q_{20})	0.264	Share part-time	0.181	0.1814
Cost of working - full ($q_{38.5}$)	0.599	Share full time	0.267	0.2661
Fixed effects distribution (q_{LIM})	0.094	Effect of the reform on non-marginal hours	4.464	4.4665

Table 4: Model Fit: Validation Moments

Effect of reform on:	Data, value	Data, Std. Error	Model
Pension points	0.206	(0.021)	0.1648
Behavioral pension points	0.134	(0.019)	0.0592
Log earnings (cond. on regular empl.)	0.162	(0.148)	0.0045
Non-marginal log earnings	1.521	(0.251)	1.7013
Regular employment	0.150	(0.027)	0.1868
Additional moments:			
Reform effect on marginal employment	—	—	-0.1483
Marginal propensity to earn (MPE)	-0.54	—	-0.6377

NOTES: The marginal propensity to consume is computed using the methodology in [**?**].
