

Occupation, model tables

June 24, 2026

Table 1: Elasticities of labor supply using different experiments

	Change in net wages	Change in pension points
Elasticity of labor supply	0.052	1.227

Table 2: Lifecycle model: counterfactual experiments

	Pension gender gap	Women's labor hours	Welfare gains wrt baseline (%)
Baseline	0.486	17.37	0.0
Caregiver credits	0.454	17.84	0.211
Caregiver credits, no threshold	0.448	17.88	0.269
Income tax deduction	0.470	18.13	0.487

NOTES: The experiments in the last three rows generate the same government revenue. Welfare gains are measured as the percentage increase in baseline consumption that makes women indifferent between the baseline and the policy experiment. Reforms apply while the child is aged 3-10.

Table 3: Model parameters and fit

Parameter	Value	Target statistics		
		Name	Data	Model
Cost of working - mini (q_{10})	0.142	Share mini-jobs	0.234	0.2336
Cost of working - part (q_{20})	0.262	Share part-time	0.181	0.1814
Cost of working - full ($q_{38.5}$)	0.584	Share full time	0.267	0.2661
Fixed effects distribution (q_{LIM})	0.062	Effect of the reform on non-marginal hours	4.464	4.4637

Table 4: Model Fit: Validation Moments

Effect of reform on:	Data, value	Data, Std. Error	Model
Pension points	0.206	(0.021)	0.1617
Behavioral pension points	0.134	(0.019)	0.0607
Log earnings (cond. on regular empl.)	0.162	(0.148)	-0.0415
Non-marginal log earnings	1.521	(0.251)	1.8403
Regular employment	0.150	(0.027)	0.2026
Additional moments:			
Reform effect on marginal employment	—	—	-0.1737
Marginal propensity to earn (MPE)	-0.54	—	-0.5832

NOTES: The marginal propensity to consume is computed using the methodology in [?].
