

Occupation, model tables

January 16, 2026

Table 1: Elasticities of labor supply using different experiments

	Change in net wages	Change in pension points
Elasticity of labor supply	0.052	1.227

Table 2: Lifecycle model: counterfactual experiments

	Pension gender gap	Women's labor hours	Average age at retirement	Welfare gains wrt baseline (%)
Baseline	0.497	17.14	64.84	0.0
Caregiver credits	0.472	17.47	64.74	0.229
Caregiver credits, no threshold	0.467	17.56	64.74	0.257
Lower income taxes	0.486	17.77	64.77	0.428

NOTES: The experiments in the last three rows generate the same government revenue. Welfare gains are measured as the percentage increase in baseline consumption that makes women indifferent between the baseline and the policy experiment. Reforms apply while the child is aged 10 or younger.

Table 3: Model parameters and fit

Parameter	Value	Target statistics		
		Name	Data	Model
Cost of working - mini (q_{10})	0.146	Share mini-jobs	0.234	0.234
Cost of working - part (q_{20})	0.247	Share part-time	0.181	0.181
Cost of working - full ($q_{38.5}$)	0.560	Share full time	0.267	0.266
Fixed effects distribution (q_{LIM})	0.072	Effect of the reform on non-marginal log earnings	1.158	1.158

Table 4: Model Fit: Validation Moments

Effect of reform on:	Data, value	Data, Std. Error	Model
Pension points	0.146	(0.027)	0.128
Behavioral pension points	0.075	(0.022)	0.037
Log earnings (cond. on regular empl.)	0.053	(0.163)	-0.023
Employed	0.118	(0.039)	0.128
Hours worked	2.489	(1.229)	2.853
Additional moments:			
Reform effect on full employment (cond. on regular empl.)	—	—	-0.029
Reform effect on marginal employment t (cond. on working)	—	—	-0.146
Marginal propensity to earn (MPE)	-0.54	—	-0.490

NOTES: MPE is computed using the methodology in [?].
