

Occupation, model tables

January 9, 2026

Table 1: Elasticities of labor supply using different experiments

	Change in net wages	Change in pension points
Elasticity of labor supply	0.052	1.227

Table 2: Lifecycle model: counterfactual experiments

	Pension gender gap	Women's labor hours	Average age at retirement	Welfare gains wrt baseline (%)
Baseline	0.663	13.34	66.01	0.0
Caregiver credits	0.646	13.67	65.96	0.138
Caregiver credits, no threshold	0.649	13.59	65.97	0.132
Lower income taxes	0.655	13.84	65.98	0.248

NOTES: The experiments in the last three rows generate the same government revenue. Welfare gains are measured as the percentage increase in baseline consumption that makes women indifferent between the baseline and the policy experiment. Reforms apply while the child is aged 10 or younger.

Table 3: Model parameters and fit

Parameter	Value	Target statistics		
		Name	Data	Model
Cost of working - mini (q_{10})	0.131	Share mini-jobs	0.302	0.302
Cost of working - part (q_{20})	0.223	Share part-time	0.142	0.142
Cost of working - full ($q_{38.5}$)	0.493	Share full time	0.175	0.175
Fixed effects distribution (q_{LIM})	2.128	Effect of the reform on non-marginal log earnings	1.158	1.158

Table 4: Model Fit: Validation Moments

Effect of reform on:	Data, value	Data, Std. Error	Model
Pension points	0.146	(0.027)	0.094
Behavioral pension points	0.075	(0.022)	0.042
Log earnings (cond. on working)	0.053	(0.163)	0.044
Employed	0.118	(0.039)	0.129
Hours worked	2.489	(1.229)	3.118
Additional moments:			
Reform effect on marginal employment	—	—	-0.208
Marginal propensity to earn (MPE)	-0.51 to -0.12	—	-0.201
